## Loading Dataset

We will use The 20 Newsgroups dataset Dataset homepage:

Scikit-learn includes some nice helper functions for retrieving the 20 Newsgroups datasethttps://scikit-learn.org/stable/modules/generated/sklearn.datasets.fetch\_20newsgroups.html. We'll use them below to retrieve the dataset.

Also look at results fron non-neural net models here: <a href="https://scikit-neural">https://scikit-neural</a>

<u>learn.org/stable/auto\_examples/text/plot\_document\_classification\_20newsgroups.html#sphx-glr-auto-examples-text-plot-document-classification-20newsgroups-py</u>

```
gpu_info = !nvidia-smi
gpu_info = '\n'.join(gpu_info)
if gpu_info.find('failed') >= 0:
   print('Select the Runtime > "Change runtime type" menu to enable a GPU accelera
   print('and then re-execute this cell.')
else.
```

```
print(gpu_info)
```

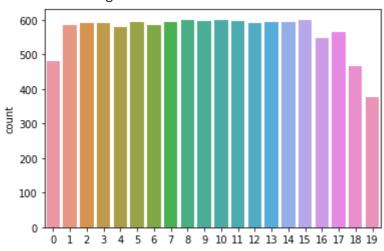

```

     /usr/local/lib/python3.6/dist-packages/transformers/tokenization utils base.py:2142:
       FutureWarning,
     Original: I am a little confused on all of the models of the 88-89 bonnevilles.
     I have heard of the LE SE LSE SSEI. Could someone tell me the
     differences are far as features or performance. I am also curious to
     know what the book value is for prefereably the 89 model. And how much
     less than book value can you usually get them for. In other words how
     much are they in demand this time of year. I have heard that the mid-spring
     early summer is the best time to buy.
     Token IDs: tensor([

```

Just for curiosity's sake, we can browse all of the model's parameters by name here.

In the below cell, I've printed out the names and dimensions of the weights for:

- 1. The embedding layer.
- 2. The first of the twelve transformers.
- 3. The output layer.

```
# Get all of the model's parameters as a list of tuples.
params = list(model.named_parameters())
print('The BERT model has {:} different named parameters.\n'.format(len(params)))
print('==== Embedding Layer ====\n')
for p in params[0:5]:
    print("{:<55} {:>12}".format(p[0], str(tuple(p[1].size()))))
print('\n==== First Transformer ====\n')
for p in params[5:21]:
    print("{:<55} {:>12}".format(p[0], str(tuple(p[1].size()))))
print('\n==== Output Layer ====\n')
for p in params[-4:]:
    print("{:<55} {:>12}".format(p[0], str(tuple(p[1].size()))))
     The BERT model has 210 different named parameters.

## 4.2. Optimizer & Learning Rate Scheduler

Now that we have our model loaded we need to grab the training hyperparameters from within the stored model.

For the purposes of fine-tuning, the authors recommend choosing from the following values (from Appendix A.3 of the <u>BERT paper</u>):

• **Batch size**: 16, 32

• Learning rate (Adam): 5e-5, 3e-5, 2e-5

• **Number of epochs:** 2, 3, 4

### We chose:

• Batch size: 32 (set when creating our DataLoaders)

• Learning rate: 2e-5

Epochs: 4 (we'll see that this is probably too many...)

The epsilon parameter eps = 1e-8 is "a very small number to prevent any division by zero in the implementation" (from <u>here</u>).

You can find the creation of the AdamW optimizer in run glue.py here.

## ▼ 4.3. Training Loop

Define a helper function for calculating accuracy.

Helper function for formatting elapsed times as hh:mm:ss

We're ready to kick off the training!

```
]
optimizer = AdamW(optimizer_grouped_parameters,
                  1r = 5e-5,
                  eps = 1e-8
no_decay = ['bias', 'LayerNorm.weight']
